

PRESENTATION OF CASEY WILLIAM NIXON

Casey has been a researcher at the Department of Earth Sciences since 2015 within the Basin and Reservoir Studies Group. He is a structural geologist working on numerous topics including fault and fracture networks, fluid flow and rift basin development. Additionally, during his time at UiB he has taken an active role in teaching, contributing to undergraduate and masters courses as well as supervising several Masters students. Casey believes that success at all levels can be achieved through collaboration and communication, so the voices of all need to be heard and taken into consideration during decision making and those decisions need to be communicated early and with clarity to those who may be affected. He hopes to make this process more effective and efficient.
