Archaeological investigation of Krakvik Loc. 14 and 16

Background

Loc. 14 at Krakvik was discovered in course of a 1996 survey that was undertaken in reference to a plan to use surplus stone from the RV 616 Langesi-Oerdeide road construction project to build two additional roads in the Rugsund area (Simpson 1996). A subsequent change of plans on part of developer called for the use of Krakvik as a temporary storage area for surplus stone and the construction of a road from a construction area to Krakvik. This change resulted in a conflict between the development plan and Loc. 14 Krakvik as an automatically preserved site (*automatisk fredet kulturminne*). The developer, Statens vegvesen, thus requested that Loc. 14 Krakvik be excluded from the protection of the Law of Antiquities. As a condition for this an archaeological investigation was undertaken by Asle Bruen Olsen and David Simpson (22/4 to 27/9-97, 7/10 to 11/10-97 and 24/10 to 25/10-97).

In the course of that investigation, while determining the extents of Loc. 14, a new Stone Age locality was discovered (Krakvik Loc. 16). The plan for the archaeological investigation was thus adjusted in order to include the new locality such that enough culture/historical data might be recovered to exclude also it from protection of the Law of Antiquities.

Goals

Inasmuch as the original survey during which Loc. 14 Krakvik was discovered demonstrated only the existence of a partially disturbed locality from the stone using period (Simpson 1996), the goal of the investigation described here was to more precisely determine its age, extent and stratigraphic integrity, as well as to collect data for interpretation of the locality's function. These same goals apply also to the new locality discovered in the course of this investigation, Loc. 16 Krakvik.

Locality 14, Krakvik (B15512)

The locality is situated in Bremanger kommune, on Rugsundøya, toward the south end of Rugsund, on the farm of Krakvik (gnr/bnr 87/1), near the fish farm operated by Rugsund Havbruk AS (figs. 1 and 2 pages 2 and 3). It is located on a low terrace (ca 6 to 11 masl) with a view of Rugsund to the east and south. The locality is evaluated as having relatively poor harbour conditions. The material collected in the course of this investigation have been assigned Aks.Nr. 22/98. The locality's B number (B15512) is identical with that assigned to the material collected in the course of the initial survey in 1996.

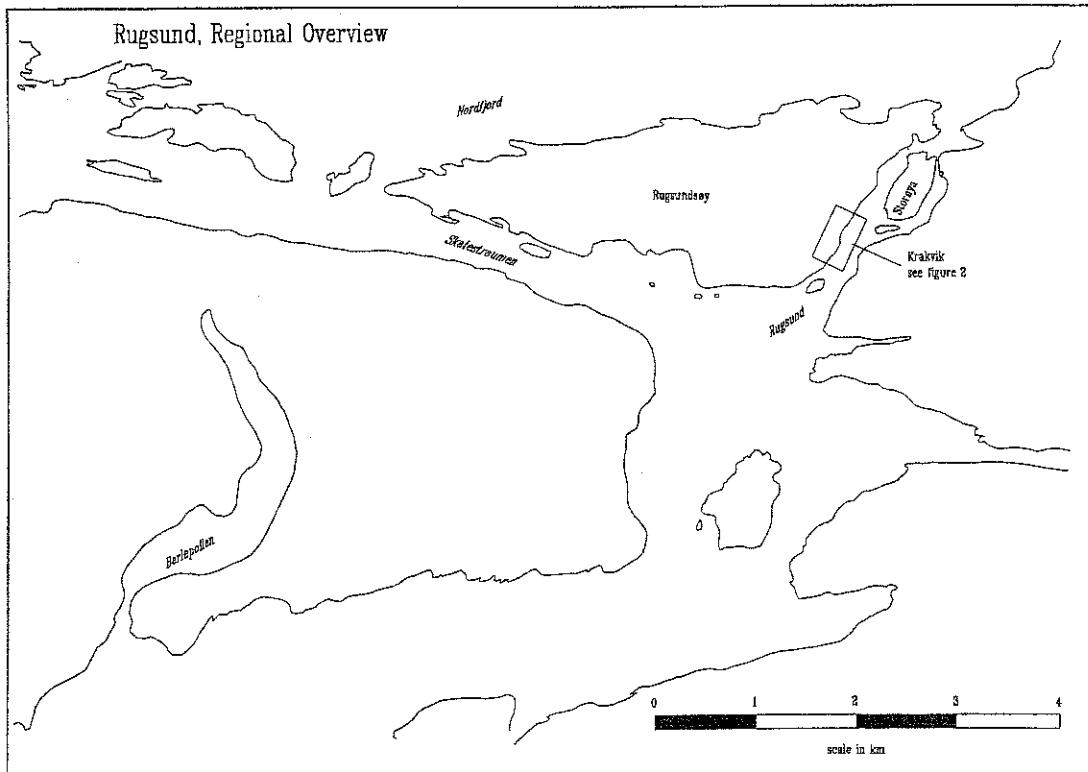

Fig. 1. Overview of Rugsund, showing the location of Krakvik.

Methods

The horizontal extent and stratigraphic integrity of this locality were investigated primarily by the excavation of a series of water screened test pits (ranging from 35 x 45 cm up to 50 X 50 cm) as well as one 1 m² unit. In the course of the investigation, an area with black charcoal rich culture layer was discovered. The method of mapping the extent of culture layer with a soil probe proved to be inconclusive here due to the high moisture content and consistency of the soil. It thus proved necessary to excavate a series of small shovel tests to determine the extent of the culture layer. These unscreened tests are marked as filled circles in fig. 3 (page 4).

In addition to the three test pits from the initial survey, five screened test pits, one 1 m² unit and four unscreened shovel tests were excavated. The screened test pits were excavated by using a combination of stratigraphic and mechanical layers/levels. Stratigraphically distinct layers were separated during excavation where this proved possible, and mechanical levels within these were separated by "bucket levels". Bucket levels generally corresponded to a volume of 10 to 12 litres of soil and a level thickness of ca 5 cm. Layers/levels were designates as a series of "bucket numbers". All level volumes and thicknesses as well as stratigraphic layer descriptions were documented on test pit forms.

Krakvik, Localites 14 and 16
Overview

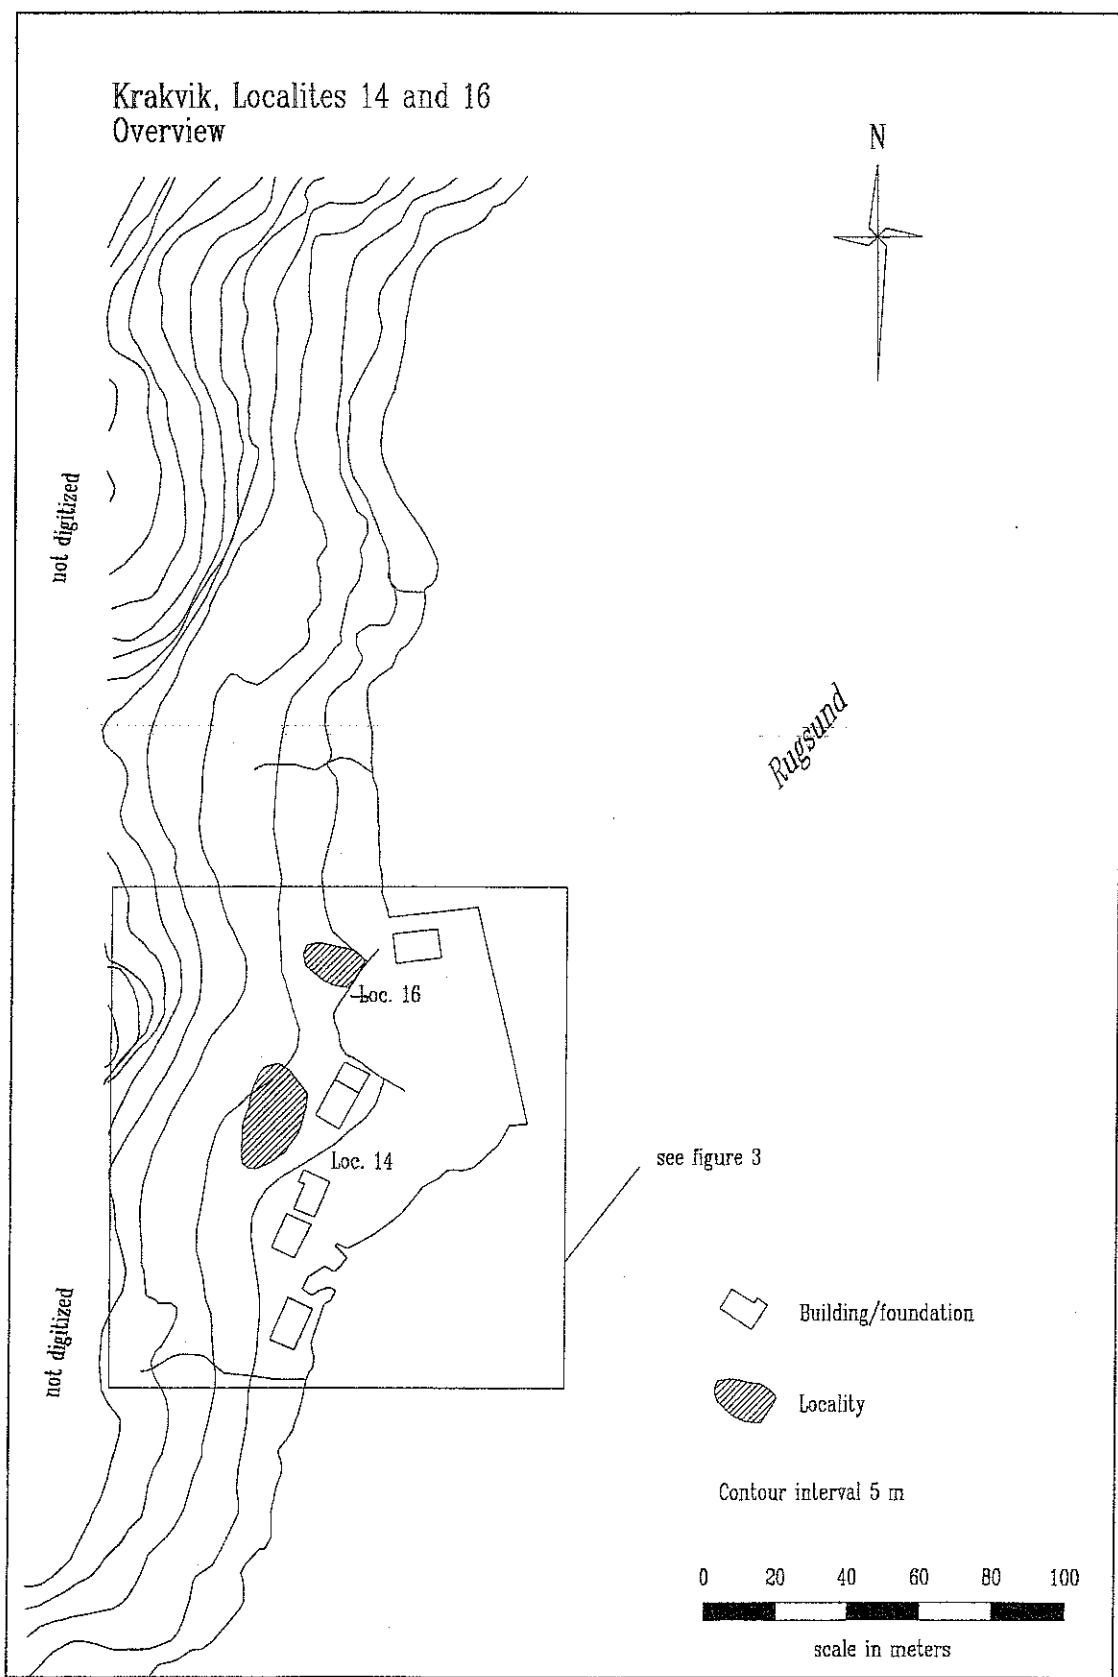

Fig. 2. Krakvik Localities 14 and 16, overview.

Krakvik, Localities 14 and 16
Detail

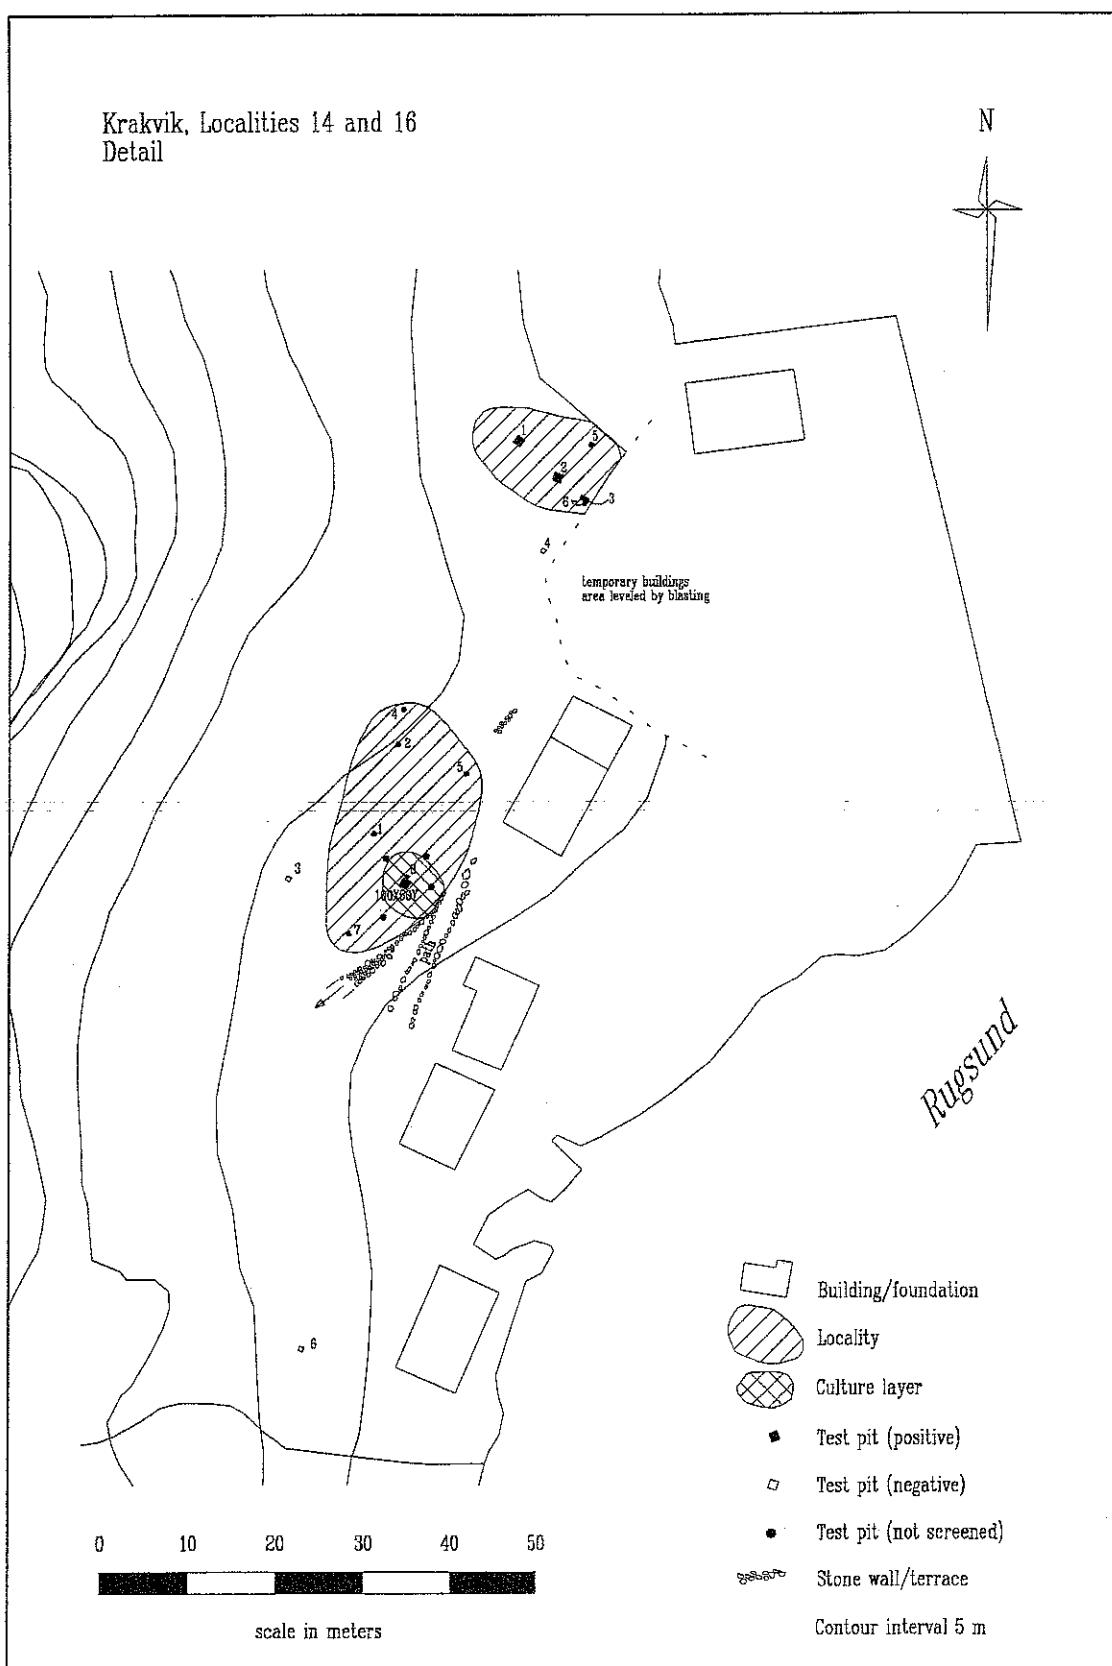

Fig. 3. Krakvik Localities 14 and 16, detail.

The one 1 m² excavation unit was also excavated by a combination of stratigraphic and mechanical layers/levels. Each stratigraphic layer was separated and designated by a layer letter. Within each layer, 5 cm thick mechanical levels were excavated and were designated by numbers. In addition, the 1 m² excavation unit was subdivided into four horizontal quadrants.

With regard to the methods employed while preparing the artefact assemblage for museum storage, all tools and pieces of potentially diagnostic debris have been marked with id numbers. In addition, with regard to lithic debris, one piece in each bag after the final sorting of the material has been similarly marked. The artefacts have been marked with both the locality's BNR (B15512) and the artefacts' FNR (*funnnummer*, that is, the project's artefact field/lab id number). It is noted that this format (i.e. B15512/34) is similar to, but distinct from BNR designations which will ultimately be published in the Bergen Museum's *Tilveksfortegnelse*. In the case of the BNR/FNR designation, each tool or piece of potentially diagnostic debris has been assigned a unique number, with debris of similar raw material types from the same excavation units being similarly assigned unique id numbers. In the case of the BNR to be published in the *Tilveksfortegnelse* the secondary number represents not a unique artefact identifier, but rather an artefact type group. Both the artefacts' FNR and *Tilveksfortegnelse* BNR are presented in the artefact list in this report such that they may be used as a key to relate the *Tilveksfortegnelse* BNRs to the specific artefacts they represent.

Results

The horizontal extent of Loc. 14 Krakvik was determined to be at least 370 m², this including an area of 40 m² of preserved culture layer. These are minimal estimates as it is possible that the locality originally extended further to the east into an area that is now heavily disturbed by recent activity (house and terrace construction).

The locality has been extensively affected by agricultural and other disturbances as reflected both by the presence of recent historic artefacts as well as the test pit profiles (fig. 4), with only the area of culture layer containing deposits that could be guaranteed to be *in situ*. The culture layer was observed to be up to 30 cm thick.

On the basis of the artefact types recovered it has proved difficult to date the locality more precisely than the previously noted determination to the stone using period (Stone Age/Bronze Age). Some of the types of lithic raw materials recovered do, however, indicate a narrower age range. The one fragment of chert recovered is of a type found to have been in use in the area in the following periods: Late Mesolithic, Early Neolithic and Pre-Roman Iron Age (pers.com. Bergsvik). The slate recovered is a classic element of a Neolithic occupation. A radio-carbon age determination from the culture layer (100X50Y, NW quad., layer B4, 37 - 43 cm below surface, 28.7 gm) yielded a result of 2780+/-60 BP, (calibrated age = BC 1045 - 815, Beta 112635)¹, that is to say, the early part of the Younger Bronze Age. The locality is thus

¹ Uncalibrated radio-carbon dates are reported as one sigma (68% probability of being correct) and calibrated dates are reported as two sigma (95% probability of being correct).

Krakvik, locality 14
Profiles

concluded to be multi-component and having been in use during at least; 1) the Late Mesolithic, Early Neolithic and/or Pre-Roman Iron Age, and 2) the early part of the Younger Bronze Age.

Due to the paucity of the assemblage recovered, it is not possible to speculate as to the possible function(s) of the locality beyond that the presence of debris indicating that the production of stone tools took place. Beyond this, the localisation of the locality along the fish rich Rugsund is suggestive of a fishing station during all phases of occupation.

Locality 16, Krakvik (B15660)

The locality is situated in Bremanger kommune, on Rugsundsøy, toward the south end of Rugsund, on the farm of Krakvik (gnr/bnr 87/1), near the fish farm operated by Rugsund Havbruk AS (figs. 1 and 2 pages 2 and 3). It is located on a terrace ca 8 masl with a view of Rugsund to the east, south and north. The locality is evaluated as having relatively poor harbour conditions. The material collected in the course of this investigation have been assigned Aks.Nr. 23/98.

Methods

The horizontal extent and stratigraphic integrity of the locality were investigated by the excavation of a series of test pits (ranging from 30 x 30 cm up to 100 X 100 cm). The 100 X 100 cm tests were divided into four quadrants. The test pits were water screened, and were excavated by using a combination of stratigraphic and mechanical layers/levels. Stratigraphically distinct layers were separated during excavation where this proved possible, and mechanical levels within these were separated by "bucket levels". Bucket levels generally corresponded to a volume of 10 to 12 litres of soil and a level thickness of ca 5 cm. Layers/levels were designates as a series of "bucket numbers". All level volumes and thicknesses as well as stratigraphic layer descriptions were documented on test pit forms.

With regard to the methods employed while preparing the artefact assemblage for museum storage, the material was treated in the same manner as for Loc. 14 above.

Results

The horizontal extent of Loc. 16 Krakvik was determined to be at least 150 m². This is a minimal estimate as it is almost certain that the locality originally extended further to the east into an area that is now heavily disturbed by recent activity (blasting/removal of bedrock, see fig. 3, page 5). The locality has also been affected to some degree by agricultural activity as indicated by disturbed layers in the upper horizons of the locality (fig. 5) as well as the presence of recent historic artefacts in these horizons.

Three principle horizons of culture/historical interest were observed:

K1 - partially agriculturally disturbed culture layer bearing artefacts of Early/Middle Neolithic character

K2 - undisturbed culture layer bearing artefacts of Early/Middle Neolithic character

K3 - sand/gravel deposit containing spread charcoal and possible Late Mesolithic elements - Early/Middle Neolithic elements are lacking

The characterisation of K1 and K2 as Early/Middle Neolithic is based primarily on the nature of the artefact assemblage recovered, including a tanged point, fragments of slate points with rhombic cross sections (one with barbed shoulders) and the presence of a relatively large amount of slate debris. The presence of chert, while possibly indicative of activity also in other periods (Late Mesolithic and/or Pre-Roman Iron Age) is consistent with an interpretation of an Early/Middle Neolithic phase (Bergsvik pers.com). The status of the Late Mesolithic phase proposed for K3 is less certain. Here the recovery of microblades and a constellation of lithic raw materials including quartz crystal, flint and chert, elements typical of the Late Mesolithic though not completely exclusive to it, were the dating criteria employed.

Radio-carbon dating samples from each of layers K1, K2 and K3 were collected. Due to the relatively small sample sized of the K2 and K3 samples, in the light of the extra cost involved in the dating of small samples and the limited budget available it was decided to date the larger sample from the lower part of the partially disturbed layer K1 (test pit 2, SE quad., layer B2, 18-20 cm below surface, 8.2 gm). This choice proved unfortunate in that it yielded a result of 1400+/-80 BP (Beta 112636), a determination clearly inconsistent with the age of the layer as indicated by the artefact assemblage. This discrepancy is interpreted to be the result of a more penetrating agricultural disturbance into layer K1 than had been expected and thereby contamination of the sample with charcoal burned from a later period.

The small size of the locality tends to preclude an interpretation of a long term occupation. The presence of projectile points (complete, damaged and under manufacture) and a variety of cores and debris are indicative of a weapon retooling station which likely also served as a hunting station. The situation of the locality along a fish rich sound is also suggestive of a site function related to fishing.

Summary and Evaluation

The principle results of this investigation were a more complete characterisation of Loc. 14 Krakvik, as well as the discovery and characterisation of an additional locality, Loc. 16 Krakvik. Loc. 14 was found to be a multi-component locality, dating most likely to the Early Neolithic and early part of the Younger Bronze Age, with the possibility of activity also having taken place in the Late Mesolithic and Pre-Roman Iron Age. The locality was determined to extend over an area of ca 370 m² (a figure only slight larger than the estimate of 350 m² proposed in the initial survey report, Simpson 1996). In addition, an area of preserved culture layer relating to an Early Bronze age occupation (40 m²) was identified. The extensive disturbance of the locality observed in the course of the survey was confirmed and found to extend over most of its area. Unfortunately, the relatively small number of artefacts recovered and the lack of structures rendered interpretations regarding the function of the locality difficult.

Loc. 16 Krakvik was determined to date to the Early/Middle Neolithic, with the possibility of an additional phase dating to the Late Mesolithic. It is of limited size, 150 m², and has also been extensively disturbed. It is interpreted to have functioned as a relatively short term hunting/fishing station, where weapon manufacture and possibly retooling also took place.

Given the disturbed nature of the localities and the small scope of the investigation it is not surprising that only these relatively limited cultural/historical conclusions could be drawn. However, again due to the poor preservation of the localities it is considered that even had there been a significantly greater investment of time and energy the results would in all likelihood have been quite similar.
