RESEARCH IN PROGRESS

- “Partially Directed Search for Wages” (*YEEA Award at EARIE 2019*) I analyse a model of partially directed search where searchers decide which firm to contact first based on correct, but incomplete, information about firms’ wages (or prices). Firms’ pure strategies are allowed to be wage distributions and in the unique symmetric pure-strategy equilibrium the wage distributions are nondegenerate. The model, thus, offers an explanation to residual wage inequality: wage dispersion arises although agents are homogeneous. The model also provides a theoretical underpinning to the empirical finding that de-unionisation led to more residual wage dispersion: if wages become less sticky in the model, wage dispersion increases.
